HumanOptics: CE-marking for innovative trifocal lens TRIVA®

Erlangen, 18 February 2020 – HumanOptics AG has received CE marking and thus approval on the European market for its new trifocal lens TRIVA-aA. With this innovative intraocular lens (IOL), the specialist for high-quality ophthalmic surgery implants is expanding its range in the rapidly growing premium lens segment.

TRIVA-aA is the first multifocal lens from HumanOptics with three focal points. Its optimized design enables patients to enjoy good vision not only at long and near distances, but also at medium distances. It is therefore particularly suitable for screen work or the use of tablets and smartphones and is tailored to the requirements of a modern, digital living environment in today's society.

The novel lens is used in cataract surgery, which is becoming increasingly important due to demographic developments. Cataract surgery is getting an increasingly refractive character, which means that in addition to cataracts, ametropia is also corrected.

The novel trifocal lenses are produced with high-precision sub-nano resolution (SNR) technology in Germany. This technology, which can only be realized by using appropriate ultra-precision lathes and makes subsequent polishing superfluous, makes HumanOptics the world leader.

Company profile:

HumanOptics AG (www.humanoptics.com) specializes in the development, production and sale of high-quality implants and accessories for ophthalmic surgery and stands for the highest quality and innovative strength in this segment. The most important products are intraocular lenses (IOL) for the treatment of cataracts and various forms of ametropia as well as artificial irises. In addition, the company offers the operating ophthalmologists accessories and complementary products as well as comprehensive consulting services. The shares of HumanOptics AG are listed on the Basic Board of the Frankfurt Stock Exchange.
